Positive predictive value of the test

The probability of disease given a **positive test** can therefore be called the "post-**test** probability of disease given a **positive test**", the "**positive predictive value**", or the "posterior probability of disease given a **positive test**". These names are interchangeable.

Problems with positive predictive ...

The positive and negative predictive values are the proportions of positive and negative results in statistics and diagnostic tests that are true positive and true negative results, respectively. The PPV and NPV describe the performance of a diagnostic test or other statistical measure. A high result can be interpreted as indicating the accuracy of such a statistic. The PPV and NPV are not intrinsic to the test; they depend also on the prevalâ
